# Extended tolerance zones

Pic. #8

$\oplus$   $\varnothing 0.3$  (M) A B [BSC]

The radial extended tolerance has an angle of 15.5 degrees. In spite of the missing MMC there is an "immanent" datum B-profit if the location of the datum B-feature varies.

$\oplus$   $\varnothing 0.3$  (M) A B (M)

The radial extended tolerance has an angle of 10.55 degrees. The existing MMC on the datum has a counterproductive effect. It reduces the extension of the tolerance.
